

Water Activated Tape

PACK SECURELY. SEAL EFFICIENTLY.

Wet or gummed paper tape consists of recyclable kraft paper coated with a natural adhesive layer. A small amount of water activates the adhesive, creating a homogeneous bond between the cardboard and the tape.

Made exclusively from renewable raw materials, wet adhesive tape is an paper-based alternative to plastic parcel or self-adhesive tape.

Automated gummed paper tape technology from OPITZ is the most reliable method of protecting your products from theft or tampering during shipping.

Width

60 – 80 mm standard, special systems up to 100 mm width

Material

Renewable raw material

Processing

When erecting, closing, or reducing the volume of folding boxes

Quick Facts

WATER ACTIVATED TAPE

Advantages at a glance

Disposal with paper waste – without separating from cardboard

Secure closure

Reduction in packaging and shipping volume

From renewable raw materials

Can be processed on all our automation solutions

Water Activated Tape

PACK SECURELY. SEAL EFFICIENTLY.

Water activated tape

Strong hold. Strong arguments.

+ Dust resistance

The homogeneous and therefore seamless connection between the cardboard box and the water activated tape protects the product against dust penetration from outside. This requirement is particularly important in the pharmaceutical industry. Unlike self-adhesive tape, water activated tape also reliably seals dusty box surfaces.

+ Recycling & material properties

Water activated tapes consist of a paper backing and adhesives made from renewable raw materials. The backing material is made from small-diameter wood, and the adhesive is produced using, among other things, plant-based raw materials such as potatoes or corn. When disposing of wet adhesive tape and cardboard, in many cases they can be recycled together as paper. It is therefore not necessary to remove the adhesive tape separately.

+ Theft protection & tamper-evident seal

After application, cardboard and water activated tape form a homogeneous bond, as they are made from the same base material (kraft paper). Unlike self-adhesive tape, this bond cannot be removed without causing damage. This means that water activated tape is considered tamper-proof and theft-proof and is recognized, for example, in air freight shipping (known consignor area).

+ Stability & durability

Compared to self-adhesive tape, water activated tape closures are considered to be very stable. Especially for heavy packages, the bottom closure provides permanent and better security for transport. Drop tests show high resistance to falls. The combination of cardboard and water activated tape is particularly resistant to fluctuations in humidity and temperature—which is especially important for overseas shipping or long storage periods. In addition, the water activated tape can be further reinforced with fibers.

Our tip:

Water activated tape can be used in all of our machines.
