

ERECTOR quick erect, quicker pack

As support for logistical processes or as the first station of a fully automated packaging line: semi- and fully automatic box erectors enrich every packaging process. In this way, cartons of different designs are quickly and reliably unfolded, sealed in the base, and made operational for further handling. Due to the use of different sealing devices, every requirement is served.

The Erector

Semi-automatic or fully automatic: the performance of the erector increases with the degree of automation and is thus entirely geared to individual requirements. But it also ensures maximum flexibility in other aspects:

FORMAT: XS to XXL

SEALING: self-adhesive tape
gummed paper tape
hotmelt glue

MAGAZINES: fully automatic erectors are equipped with up to 4 magazines

semi-automatic bottom-folding device for automatic box erecting

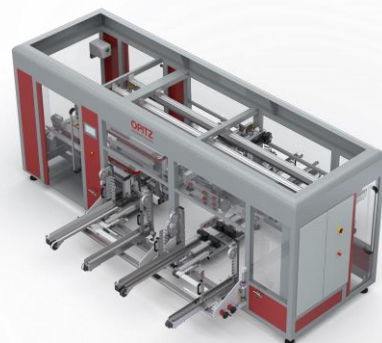

practical work assistance for the distribution department

Processing of different box formats without retooling

fully automatic box erector with up to 4 magazines without the need for operatin personnel

wide processing range, special solutions for extra large formats

maximum flexibility due to short retooling times

The process

semi-automatic: the carton is fed manually to the bottom-folding device and the bottom flaps are folded in automatically. The erected box can be filled and transferred for separate closure.

fully automatic: the carton blank is automatically removed from the magazine and set up as a sleeve. After the bottom flaps have been folded in, the underside of the box is sealed with the desired sealing material and made ready for further processing.
