

## SEALER fast & flexible

A secure closure is the basis for reliable packaging. The requirements for this closure can be diverse. Regardless of whether it is simply the lid flaps that need to be closed or cartons that do not conform to the standard format that need to be processed - Opitz offers the right solution for every need.

### The automation level

#### semi-automatic

- support of the staff
- quick help during short-term demand peaks (e.g. Black Friday, Christmas)
- low investment costs, high benefit
- flexible use due to compact format

#### fully automatic

- sealing without the need for personnel
- high performance due to different stations in one system
- integration into logistics systems or as stand-alone machine
- positionally accurate sealing without downtimes

- processing of different box formats in varying order
- sealing with self-adhesive tape or water activated tape
- simple operation

## The sealing types

Besides the process of closing, the type of sealing also plays an important role in protecting the products to be packaged. The following variants can be implemented as standard in our Opitz sealers. We can meet special requirements, for example, by combining the closure variants.

U-closure

The U-closure is considered the standard and is the most commonly used. It can be supplemented with a user-friendly tear strip.

with tear strip

C-closure

← Ultra flat packages can be sealed with a C-closure.

The Clip-closure ensures additional stability. For example for separate attached lids or flat packages. →
